Number of ways to pick a multiset of size k from n elements: $\binom{n+k-1}{k}$

Number of n -tuples of non-negative integers with sum s : $\binom{s+n-1}{n-1}$, at most s : $\binom{s+n}{n}$

Number of n -tuples of positive integers with sum s : $\binom{s-1}{n-1}$

Number of lattice paths from $(0,0)$ to (a,b) , restricted to east and north steps: $\binom{a+b}{a}$

Catalan numbers $C_n = \frac{1}{n+1} \binom{2n}{n}$. $C_0 = 1$, $C_n = \sum_{i=0}^{n-1} C_i C_{n-1-i}$. $C_{n+1} = C_n \frac{4n+2}{n+2}$.

$C_0, C_1, \dots = 1, 1, 2, 5, 14, 42, 132, 429, 1430, 4862, 16796, 58786, 208012, 742900, \dots$

C_n is the number of: properly nested sequences of n pairs of parentheses; rooted ordered binary trees with $n+1$ leaves; triangulations of a convex $(n+2)$ -gon.

Derangements . Number of permutations of $n = 0, 1, 2, \dots$ elements without fixed points is $1, 0, 1, 2, 9, 44, 265, 1854, 14833, \dots$ Recurrence: $D_n = (n-1)(D_{n-1} + D_{n-2}) = nD_{n-1} + (-1)^n$. Corollary: number of permutations with exactly k fixed points is $\binom{n}{k} D_{n-k}$.

Stirling numbers of 1st kind . $s_{n,k}$ is $(-1)^{n-k}$ times the number of permutations of n elements with exactly k permutation cycles. $[n]_k = |s_{n,k}| = |s_{n-1,k-1}| + (n-1)|s_{n-1,k}|$ $s(0,0) = 1$ and $s(n,0) = s(0,n) = 0$.

Stirling numbers of 2nd kind . $S_{n,k}$ is the number of ways to partition a set of n elements into exactly k non-empty subsets. $\{n\}_k = S_{n,k} = S_{n-1,k-1} + kS_{n-1,k}$. $S_{n,1} = S_{n,n} = 1$.

Bell numbers . B_n is the number of partitions of n elements. $B_0, \dots = 1, 1, 2, 5, 15, 52, 203, 877, \dots$
 $B_{n+1} = \sum_{k=0}^n \binom{n}{k} B_k = \sum_{k=1}^{n+1} S_{n,k}$. Bell triangle: $B_r = a_{r,1} = a_{r-1,r-1}$, $a_{r,c} = a_{r-1,c-1} + a_{r,c-1}$.

Eulerian numbers . $E(n, k) = \langle \binom{n}{k} \rangle$ is the number of permutations with exactly k descents ($i : \pi_i < \pi_{i+1}$) / ascents ($\pi_i > \pi_{i+1}$) / excedances ($\pi_i > i$) / $k+1$ weak excedances ($\pi_i \geq i$).

Formula: $E(n, m) = (m+1)E(n-1, m) + (n-m)E(n-1, m-1)$. $E(n, 0) = E(n, n-1) = 1$.
 $E(n, m) = \sum_{k=0}^m (-1)^k \binom{n+1}{k} (m+1-k)^n$.

Double factorial . Permutations of the multiset $\{1, 1, 2, 3, \dots, n, n\}$ such that for each k , all the numbers between two occurrences of k in the permutation are greater than k . $(2n-1)!! = \prod_{k=1}^n (2k-1)$.

Eulerian numbers of 2^{nd} kind . Related to Double factorial, number of all such permutations that have exactly m ascents. $\langle \langle \binom{n}{m} \rangle \rangle = (2n-m-1) \langle \langle \binom{n-1}{m-1} \rangle \rangle + (m+1) \langle \langle \binom{n-1}{m} \rangle \rangle$. $\langle \langle \binom{n}{0} \rangle \rangle = 1$

Multinomial theorem . $(a_1 + \dots + a_k)^n = \sum \binom{n}{n_1, \dots, n_k} a_1^{n_1} \dots a_k^{n_k}$, where $n_i \geq 0$ and $\sum n_i = n$.
 $\binom{n}{n_1, \dots, n_k} = M(n_1, \dots, n_k) = \frac{n!}{n_1! \dots n_k!}$. $M(a, \dots, b, c, \dots) = M(a + \dots + b, c, \dots) M(a, \dots, b)$

Burnside's lemma . The number of orbits under group G 's action on set X :

$|X/G| = \frac{1}{|G|} \sum_{g \in G} |X_g|$, where $X_g = \{x \in X : g(x) = x\}$. ("Average number of fixed points.")

Let $w(x)$ be weight of x 's orbit. Sum of all orbits' weights: $\sum_{o \in X/G} w(o) = \frac{1}{|G|} \sum_{g \in G} \sum_{x \in X_g} w(x)$.

Data structures (BIT, BIT2D, RMQ-DP, RMQ-segment tree, union-find, misof's tree)

BIT - Binary indexed trees

```
int bit[M], n;
void update(int x, int v) { while( x <= n ) { bit[x] += v; x += x & -x; } }
int sum(int x) { int ret=0; while(x>0){ ret += bit[x]; x -= x & -x; } return ret; }
```

BIT 2D

```
int bit[M][M], n;
int sum( int x, int y ){
    int ret = 0;
    while( x > 0 ){
        int yy = y; while( yy > 0 ) ret += bit[x][yy], yy -= yy & -yy;
        x -= (x & -x);
    }
    return ret ;
}
void update(int x , int y , int val){
    int y1;
    while (x <= n){
        y1 = y;
        while (y1 <= n){ bit[x][y1] += val; y1 += (y1 & -y1); }
        x += (x & -x);
    }
}
```

RMQ DP

```
int make_dp(int n) { // N log N
    REP(i,n) H[i][0]=i;
    for(int l=0,k; (k=1<<l) < n; l++) for(int i=0;i+k<n;i++)
        H[i][l+1] = A[H[i][l]] > A[H[i+k][l]] ? H[i+k][l] : H[i][l];
} // query log N almost O(1)
```

```

int query_dp(int a, int b) {
    for(int l=0;;l++)if(a+(1<<l+1) > b) {
        int o2 = H[b-(1<<l)+1][1];
        return A[H[a][1]]<A[o2] ? H[a][1]:o2;
    }
}

```

RMQ segment tree

```

const int M = 100005;
int n, in[M], f[M], st[M], en[M];
struct data { int l, r, ans, next_l, next_r; };
data d[4*M]; // which is the range? :S
int nd;
int build( int l, int r, int id ) {

            }
        }
        else right = query( l, r, d[id].next_r );
        return max( left, right );
    }
}

```

Union find - rank by number of elements

```

struct unionfind {
    int p[MAX], r[MAX]; // r contains the population
    unionfind() { REP(i,MAX) p[i] = i, r[i] = 1; }
    int find( int x ) { if( p[x] == x ) return x; else return p[x] = find( p[x] ); }
    void Union(int x, int y) {
        int px = find( x ), py = find( y );
        if( px == py ) return; //already joined
        if( r[ px ] < r[ py ] ) p[px] = py, r[py] += r[px];
        else p[ py ] = px, r[px] += r[py];
    }
}

```

```

    }
};

```

misof's tree

```

int tree[17][65536];
void insert(int x) { for (int i=0; i<17; i++) { tree[i][x]++; x/=2; } }
void erase(int x) { for (int i=0; i<17; i++) { tree[i][x]--; x/=2; } }
int kThElement(int k) { int a=0, b=16;
    while (b-->0) { a*=2; if (tree[b][a]<k) k-=tree[b][a]; }
    return a; }

```

Number theory (*gcd, totient, sieve, modexp, rabinmiller)

Linear diophantine equation . $ax + by = c$. Let $d = \gcd(a, b)$. A solution exists iff $d|c$. If (x_0, y_0) is any solution, then all solutions are given by $(x, y) = (x_0 + \frac{b}{d}t, y_0 - \frac{a}{d}t)$, $t \in \mathbb{Z}$. To find some solution (x_0, y_0) , use extended GCD to solve $ax_0 + by_0 = d = \gcd(a, b)$, and multiply its solutions by $\frac{c}{d}$.

Linear diophantine equation in n variables: $a_1x_1 + \dots + a_nx_n = c$ has solutions iff $\gcd(a_1, \dots, a_n)|c$. To find some solution, let $b = \gcd(a_2, \dots, a_n)$, solve $a_1x_1 + by = c$, and iterate with $a_2x_2 + \dots = y$.
Multiplicative inverse of a modulo m : x in $ax + my = 1$, or $a^{\phi(m)-1} \pmod{m}$.

Chinese Remainder Theorem . System $x \equiv a_i \pmod{m_i}$ for $i = 1, \dots, n$, with pairwise relatively-prime m_i has a unique solution modulo $M = m_1m_2\dots m_n$: $x = a_1b_1\frac{M}{m_1} + \dots + a_nb_n\frac{M}{m_n} \pmod{M}$, where b_i is modular inverse of $\frac{M}{m_i}$ modulo m_i .

System $x \equiv a \pmod{m}$, $x \equiv b \pmod{n}$ has solutions iff $a \equiv b \pmod{g}$, where $g = \gcd(m, n)$. The solution is unique modulo $L = \frac{mn}{g}$, and equals: $x \equiv a + T(b - a)m/g \equiv b + S(a - b)n/g \pmod{L}$, where S and T are integer solutions of $mT + nS = \gcd(m, n)$.

Prime-counting function . $\pi(n) = |\{p \leq n : p \text{ is prime}\}|$. $n/\ln(n) < \pi(n) < 1.3n/\ln(n)$.
 $\pi(1000) = 168$, $\pi(10^6) = 78498$, $\pi(10^9) = 50\,847\,534$. n -th prime $\approx n \ln n$.

Miller-Rabin's primality test . Given $n = 2^r s + 1$ with odd s , and a random integer $1 < a < n$. If $a^s \equiv 1 \pmod{n}$ or $a^{2^j s} \equiv -1 \pmod{n}$ for some $0 \leq j \leq r-1$, then n is a probable prime. With bases 2, 7 and 61, the test identifies all composites below 2^{32} . Probability of failure for a random a is at most $1/4$.

Pollard- ρ . Choose random x_1 , and let $x_{i+1} = x_i^2 - 1 \pmod{n}$. Test $\gcd(n, x_{2^k+i} - x_{2^k})$ as possible n 's factors for $k = 0, 1, \dots$. Expected time to find a factor: $O(\sqrt{m})$, where m is smallest prime power in n 's factorization. That's $O(n^{1/4})$ if you check $n = p^k$ as a special case before factorization.

Fermat primes . A Fermat prime is a prime of form $2^{2^n} + 1$. The only known Fermat primes are 3, 5, 17, 257, 65537. A number of form $2^n + 1$ is prime only if it is a Fermat prime.

Perfect numbers . $n > 1$ is called perfect if it equals sum of its proper divisors and 1. Even n is perfect iff $n = 2^{p-1}(2^p - 1)$ and $2^p - 1$ is prime (Mersenne's). No odd perfect numbers are yet found.

Carmichael numbers . A positive composite n is a Carmichael number ($a^{n-1} \equiv 1 \pmod{n}$ for all a : $\gcd(a, n) = 1$), iff n is square-free, and for all prime divisors p of n , $p-1$ divides $n-1$.

Number/sum of divisors . $\tau(p_1^{a_1} \dots p_k^{a_k}) = \prod_{j=1}^k (a_j + 1)$. $\sigma(p_1^{a_1} \dots p_k^{a_k}) = \prod_{j=1}^k \frac{p_j^{a_j+1} - 1}{p_j - 1}$.

Euler's phi function . $\phi(n) = |\{m \in \mathbb{N}, m \leq n, \gcd(m, n) = 1\}|$.

$\phi(mn) = \frac{\phi(m)\phi(n)\gcd(m, n)}{\phi(\gcd(m, n))}$. $\phi(p^a) = p^{a-1}(p-1)$. $\sum_{d|n} \phi(d) = \sum_{d|n} \phi(\frac{n}{d}) = n$.

Euler's theorem . $a^{\phi(n)} \equiv 1 \pmod{n}$, if $\gcd(a, n) = 1$.

Wilson's theorem . p is prime iff $(p-1)! \equiv -1 \pmod{p}$.

Mobius function . $\mu(1) = 1$. $\mu(n) = 0$, if n is not squarefree. $\mu(n) = (-1)^s$, if n is the product of s distinct primes. Let f, F be functions on positive integers. If for all $n \in \mathbb{N}$, $F(n) = \sum_{d|n} f(d)$, then $f(n) = \sum_{d|n} \mu(d)F(\frac{n}{d})$, and vice versa. $\phi(n) = \sum_{d|n} \mu(d)\frac{n}{d}$. $\sum_{d|n} \mu(d) = 1$.

If f is multiplicative, then $\sum_{d|n} \mu(d)f(d) = \prod_{p|n} (1 - f(p))$, $\sum_{d|n} \mu(d)^2 f(d) = \prod_{p|n} (1 + f(p))$.

Legendre symbol . If p is an odd prime, $a \in \mathbb{Z}$, then $\left(\frac{a}{p}\right)$ equals 0, if $p|a$; 1 if a is a quadratic residue modulo p ; and -1 otherwise. Euler's criterion: $\left(\frac{a}{p}\right) = a^{\left(\frac{p-1}{2}\right)} \pmod{p}$.

Jacobi symbol . If $n = p_1^{a_1} \cdots p_k^{a_k}$ is odd, then $\left(\frac{a}{n}\right) = \prod_{i=1}^k \left(\frac{a}{p_i}\right)^{a_i}$.

Primitive roots . If the order of g modulo m ($\min n > 0: g^n \equiv 1 \pmod{m}$) is $\phi(m)$, then g is called a primitive root. If Z_m has a primitive root, then it has $\phi(\phi(m))$ distinct primitive roots. Z_m has a primitive root iff m is one of $2, 4, p^k, 2p^k$, where p is an odd prime. If Z_m has a primitive root g , then for all a coprime to m , there exists unique integer $i = \text{ind}_g(a)$ modulo $\phi(m)$, such that $g^i \equiv a \pmod{m}$. $\text{ind}_g(a)$ has logarithm-like properties: $\text{ind}(1) = 0$, $\text{ind}(ab) = \text{ind}(a) + \text{ind}(b)$.

If p is prime and a is not divisible by p , then congruence $x^n \equiv a \pmod{p}$ has $\text{gcd}(n, p-1)$ solutions if $a^{(p-1)/\text{gcd}(n, p-1)} \equiv 1 \pmod{p}$, and no solutions otherwise. (Proof sketch: let g be a primitive root, and $g^i \equiv a \pmod{p}$, $g^u \equiv x \pmod{p}$. $x^n \equiv a \pmod{p}$ iff $g^{nu} \equiv g^i \pmod{p}$ iff $nu \equiv i \pmod{p}$.)

Discrete logarithm problem . Find x from $a^x \equiv b \pmod{m}$. Can be solved in $O(\sqrt{m})$ time and space with a meet-in-the-middle trick. Let $n = \lceil \sqrt{m} \rceil$, and $x = ny - z$. Equation becomes $a^{ny} \equiv ba^z \pmod{m}$. Precompute all values that the RHS can take for $z = 0, 1, \dots, n-1$, and brute force y on the LHS, each time checking whether there's a corresponding value for RHS.

Pythagorean triples . Integer solutions of $x^2 + y^2 = z^2$. All relatively prime triples are given by: $x = 2mn, y = m^2 - n^2, z = m^2 + n^2$ where $m > n, \text{gcd}(m, n) = 1$ and $m \not\equiv n \pmod{2}$. All other triples are multiples of these. Equation $x^2 + y^2 = 2z^2$ is equivalent to $\left(\frac{x+y}{2}\right)^2 + \left(\frac{x-y}{2}\right)^2 = z^2$.

Postage stamps/McNuggets problem . Let a, b be relatively-prime integers. There are exactly $\frac{1}{2}(a-1)(b-1)$ numbers *not* of form $ax+by$ ($x, y \geq 0$), and the largest is $(a-1)(b-1)-1 = ab-a-b$.

Fermat's two-squares theorem . Odd prime p can be represented as a sum of two squares iff $p \equiv 1 \pmod{4}$. A product of two sums of two squares is a sum of two squares. Thus, n is a sum of two squares iff every prime of form $p = 4k+3$ occurs an even number of times in n 's factorization.

Congruence $ax \equiv b \pmod{n}$

```
int congruence( int a, int b, int n ) { // finds ax = b(mod n)
    int d = gcd( a, n );
    if( b % d != 0 ) return 1<<30; // no solution
    pii ans = egcd( a, n );
    int ret = ans.x * ( b/d + 0LL ), mul = n/d;
    ret %= mul;
    if( ret < 0 ) ret += mul;
    return ret;
}
```

Extended GCD

```
pii egcd( LL a, LL b ) { // returns x,y | ax + by = gcd(a,b)
    if( b == 0 ) return pii( 1, 0 );
    else {
        pii d = egcd( b, a % b );
        return pii( d.y, d.x - d.y * ( a / b ) );
    }
}
```

GCD

```
LL gcd( LL a, LL b ) { return !b ? a : gcd( b, a%b ); }
```

General EGCD

```

template<class T> inline T euclid(T a,T b,T &X,T &Y)
{
    if(a<0) { T d=euclid(-a,b,X,Y); X=-X; return d; }

```

Euler's theorem . For any planar graph, $V - E + F = 1 + C$, where V is the number of graph's vertices, E is the number of edges, F is the number of faces in graph's planar drawing, and C is the number of connected components. Corollary: $V - E + F = 2$ for a 3D polyhedron.

Vertex covers and independent sets . Let M, C, I be a max matching, a min vertex cover, and a max independent set. Then $|M| \leq |C| = N - |I|$, with equality for bipartite graphs. Complement of an MVC is always a MIS, and vice versa. Given a bipartite graph with partitions (A, B) , build a network: connect source to A , and B to sink with edges of capacities, equal to the corresponding nodes' weights, or 1 in the unweighted case. Set capacities of the original graph's edges to the infinity. Let (S, T) be a minimum s - t cut. Then a maximum(-weighted) independent set is $I = (A \cap S) \cup (B \cap T)$, and a minimum(-weighted) vertex cover is $C = (A \cap T) \cup (B \cap S)$.

Matrix-tree theorem . Let matrix $T = [t_{ij}]$, where t_{ij} is the number of multiedges between i and j , for $i \neq j$, and $t_{ii} = -\deg_i$. Number of spanning trees of a graph is equal to the determinant of a matrix obtained by deleting any k -th row and k -th column from T .

Euler tours . Euler tour in an undirected graph exists iff the graph is connected and each vertex has an even degree. Euler tour in a directed graph exists iff in-degree of each vertex equals its out-degree, and underlying undirected graph is connected.

Stable marriages problem . While there is a free man m : let w be the most-preferred woman to whom he has not yet proposed, and propose m to w . If w is free, or is engaged to someone whom she prefers less than m , match m with w , else deny proposal.

Stoer-Wagner's min-cut algorithm . Start from a set A containing an arbitrary vertex. While $A \neq V$, add to A the most tightly connected vertex ($z \notin A$ such that $\sum_{x \in A} w(x, z)$ is maximized.) Store cut-of-the-phase (the cut between the last added vertex and rest of the graph), and merge the two vertices added last. Repeat until the graph is contracted to a single vertex. Minimum cut is one of the cuts-of-the-phase.

2-SAT . Build an implication graph with 2 vertices for each variable – for the variable and its inverse; for each clause $x \vee y$ add edges (\bar{x}, y) and (\bar{y}, x) . The formula is satisfiable iff x and \bar{x} are in distinct SCCs, for all x . To find a satisfiable assignment, consider the graph's SCCs in topological order from sinks to sources (i.e. Kosaraju's last step), assigning 'true' to all variables of the current SCC (if it hasn't been previously assigned 'false'), and 'false' to all inverses.

Randomized algorithm for non-bipartite matching . Let G be a simple undirected graph with even $|V(G)|$. Build a matrix A , which for each edge $(u, v) \in E(G)$ has $A_{i,j} = x_{i,j}$, $A_{j,i} = -x_{i,j}$, and is zero elsewhere. Tutte's theorem: G has a perfect matching iff $\det G$ (a multivariate polynomial) is identically zero. Testing the latter can be done by computing the determinant for a few random values of $x_{i,j}$'s over some field. (e.g. Z_p for a sufficiently large prime p)

Prüfer code of a tree . Label vertices with integers 1 to n . Repeatedly remove the leaf with the smallest label, and output its only neighbor's label, until only one edge remains. The sequence has length $n - 2$. Two isomorphic trees have the same sequence, and every sequence of integers from 1 and n corresponds to a tree. Corollary: the number of labelled trees with n vertices is n^{n-2} .

Erdos-Gallai theorem . A sequence of integers $\{d_1, d_2, \dots, d_n\}$, with $n - 1 \geq d_1 \geq d_2 \geq \dots \geq d_n \geq 0$ is a degree sequence of some undirected simple graph iff $\sum d_i$ is even and $d_1 + \dots + d_k \leq k(k-1) + \sum_{i=k+1}^n \min(k, d_i)$ for all $k = 1, 2, \dots, n - 1$.

Games theory (Grundy, Misère)

Grundy numbers . For a two-player, normal-play (last to move wins) game on a graph (V, E) : $G(x) = \text{mex}(\{G(y) : (x, y) \in E\})$, where $\text{mex}(S) = \min\{n \geq 0 : n \notin S\}$. x is losing iff $G(x) = 0$.

Misère Nim . A position with pile sizes $a_1, a_2, \dots, a_n \geq 1$, not all equal to 1, is losing iff $a_1 \oplus a_2 \oplus \dots \oplus a_n = 0$ (like in normal nim.) A position with n piles of size 1 is losing iff n is *odd*.

Geometry

Circle using three points Let $A = (0, 0)$ centers are $(C_y(B_x^2 + B_y^2) - B_y(C_x^2 + C_y^2))/D$ and $(B_x(C_x^2 + C_y^2) - C_x(B_x^2 + B_y^2))/D$ where $D = 2(B_x C_y - B_y C_x)$.

Pick's theorem . $I = A - B/2 + 1$, where A is the area of a lattice polygon, I is number of lattice points inside it, and B is number of lattice points on the boundary. Number of lattice points minus one on a line segment from $(0, 0)$ and (x, y) is $\gcd(x, y)$.

$$a \cdot b = a_x b_x + a_y b_y = |a| \cdot |b| \cdot \cos(\theta)$$

$$a \times b = a_x b_y - a_y b_x = |a| \cdot |b| \cdot \sin(\theta)$$

$$3D: a \times b = (a_y b_z - a_z b_y, a_z b_x - a_x b_z, a_x b_y - a_y b_x)$$

Line $ax + by = c$ through $A(x_1, y_1)$ and $B(x_2, y_2)$: $a = y_1 - y_2$, $b = x_2 - x_1$, $c = ax_1 + by_1$.

Half-plane to the left of the directed segment AB : $ax + by \geq c$.

Normal vector: (a, b) . Direction vector: $(b, -a)$. Perpendicular line: $-bx + ay = d$.

Point of intersection of $a_1 x + b_1 y = c_1$ and $a_2 x + b_2 y = c_2$ is $\frac{1}{a_1 b_2 - a_2 b_1} (c_1 b_2 - c_2 b_1, a_1 c_2 - a_2 c_1)$.

Distance from line $ax + by + c = 0$ to point (x_0, y_0) is $|ax_0 + by_0 + c| / \sqrt{a^2 + b^2}$.

Distance from line AB to P (for any dimension): $\frac{|(A-P) \times (B-P)|}{|A-B|}$.

Point-line segment distance: TODO

Projection of point C onto line AB is $\frac{AB \cdot AC}{AB \cdot AB} AB$.

Projection of (x_0, y_0) onto line $ax + by = c$ is $(x_0, y_0) + \frac{1}{a^2 + b^2} (ad, bd)$, where $d = c - ax_0 - by_0$.

Projection of the origin is $\frac{1}{a^2 + b^2} (ac, bc)$.

Segment-segment intersection . Two line segments intersect if one of them contains an endpoint of the other segment, or each segment straddles the line, containing the other segment (AB straddles line l if A and B are on the opposite sides of l .)

Circle-circle and circle-line intersection

TODO

Circle from 3 points (circumcircle) . Intersect two perpendicular bisectors. Line perpendicular to $ax + by = c$ has the form $-bx + ay = d$. Find d by substituting midpoint's coordinates.

Angular bisector of angle ABC is line BD , where $D = \frac{BA}{|BA|} + \frac{BC}{|BC|}$.

Center of incircle of triangle ABC is at the intersection of angular bisectors, and is $\frac{a}{a+b+c}A + \frac{b}{a+b+c}B + \frac{c}{a+b+c}C$, where a, b, c are lengths of sides, opposite to vertices A, B, C . Radius = $\frac{2S}{a+b+c}$.

Counter-clockwise rotation around the origin . $(x, y) \mapsto (x \cos \phi - y \sin \phi, x \sin \phi + y \cos \phi)$.

90-degrees counter-clockwise rotation: $(x, y) \mapsto (-y, x)$. Clockwise: $(x, y) \mapsto (y, -x)$.

3D rotation by ccw angle ϕ around axis \mathbf{n} : $\mathbf{r}' = \mathbf{r} \cos \phi + \mathbf{n}(\mathbf{n} \cdot \mathbf{r})(1 - \cos \phi) + (\mathbf{n} \times \mathbf{r}) \sin \phi$

Plane equation from 3 points . $N \cdot (x, y, z) = N \cdot A$, where N is normal: $N = (B - A) \times (C - A)$.

3D figures

Sphere	Volume $V = \frac{4}{3}\pi r^3$, surface area $S = 4\pi r^2$ $x = \rho \sin \theta \cos \phi, y = \rho \sin \theta \sin \phi, z = \rho \cos \theta, \phi \in [-\pi, \pi], \theta \in [0, \pi]$
Spherical section	Volume $V = \pi h^2(r - h/3)$, surface area $S = 2\pi r h$
Pyramid	Volume $V = \frac{1}{3}hS_{base}$
Cone	Volume $V = \frac{1}{3}\pi r^2 h$, lateral surface area $S = \pi r \sqrt{r^2 + h^2}$

Area of a simple polygon . $\frac{1}{2} \sum_{i=0}^{n-1} (x_i y_{i+1} - x_{i+1} y_i)$, where $x_n = x_0, y_n = y_0$.

Area is negative if the boundary is oriented clockwise.

Winding number . Shoot a ray from given point in an arbitrary direction. For each intersection of ray with polygon's side, add +1 if the side crosses it counterclockwise, and -1 if clockwise.

Convex Hull
